

# The Future of Work: How AI is Changing the Job Landscape

AI is a field that is growing dramatically these days. It shows that it may replace human work very soon because it shows finishing the job in seconds, making it neat and reaching the goal of the work, and most importantly 95% cheaper to maintain than humans.

Before we dive in more, **What is AI?**

AI or artificial intelligence allows computers and machines to understand human language and problem-solve stuff like Troubleshooting a computer problem or giving you a food recipe you can make with the things you have in your fridge also they can generate images for you there are endless things you can do with them.

How AI is used for **creativity?**

For example, as mentioned earlier, You can generate images With AI which is true but the thing is that you can generate any type of image, for example, you can generate an art image like for example Toronto in 2050 and it will give you a creative art drawing.

How AI is used for **programming?**

AI also can do programming for you if you ask it to it can program in whatever language you want like Python, HTML, c, and much much more But you have to bear in mind that it may do 85% of the task you are trying to achieve but the rest you have to complete because this industry is not perfect yet, but it is improving and still about 85% of the work is done you just have to put the final touches so it is still a great tool for programming

## Can AI replace jobs in the future?

Yes, it may replace some jobs like cashier and customer services but there must be some humans to manage them and check them because they are machines that can malfunction so there must be humans to fix them and check them now and then and everything will be good.

## In Conclusion

While AI may replace human jobs it needs to be monitored by humans and it will not and never replace humans, instead it will make their lives easier
